1 Algorithms

1.1 Mo's algorithm on trees

```
/*
-----
Problem:
-----
https://www.spoj.com/problems/COT2/
Given a tree with N nodes and Q queries. Each node has an integer weight.
```

Each query provides two numbers u and v, ask for how many different integers weight of nodes there are on path from u to v.

Modify DFS:

For each node u, maintain the start and the end DFS time. Let's call them ST(u) and EN(u).

=> For each query, a node is considered if its occurrence count is one.

Query solving:

Let's query be (u, v). Assume that ST(u) <= ST(v). Denotes P as LCA(u, v).

Case 1: P = u

Our query would be in range [ST(u), ST(v)].

Case 2: P != u

Our query would be in range [EN(u), ST(v)] + [ST(p), ST(p)]

*/

```
void update(int &L, int &R, int qL, int qR){
    while (L > qL) add(--L);
    while (R < qR) add(++R);

    while (L < qL) del(L++);
    while (R > qR) del(R--);
}

vector<int> MoQueries(int n, vector<query> Q){
    block_size = sqrt((int)nodes.size());
    sort(Q.begin(), Q.end(), [](const query &A, const query &B){
        return (ST[A.l]/block_size != ST[B.l]/block_size)?
            (ST[A.l]/block_size < ST[B.l]/block_size) : (ST[A.r] <
            ST[B.r]);
    });
    vector<int> res;
    res.resize((int)Q.size());

    LCA lca;
    lca.initialize(n);

    int L = 1, R = 0;
```

```

for(query q: Q){
    int u = q.l, v = q.r;
    if(ST[u] > ST[v]) swap(u, v); // assume that S[u] <= S[v]
    int parent = lca.get(u, v);

    if(parent == u){
        int qL = ST[u], qR = ST[v];
        update(L, R, qL, qR);
    }else{
        int qL = EN[u], qR = ST[v];
        update(L, R, qL, qR);
        if(cnt_val[a[parent]] == 0)
            res[q.pos] += 1;
    }

    res[q.pos] += cur_ans;
}
return res;
}

```

1.2 Mo's algorithm

```

/*
https://www.spoj.com/problems/FREQ2/
*/
vector<int> MoQueries(int n, vector<query> Q){

    block_size = sqrt(n);
    sort(Q.begin(), Q.end(), [](const query &A, const query &B){
        return (A.l/block_size != B.l/block_size)? (A.l/block_size <
            B.l/block_size) : (A.r < B.r);
    });
    vector<int> res;
    res.resize((int)Q.size());

    int L = 1, R = 0;
    for(query q: Q){
        while (L > q.l) add(--L);
        while (R < q.r) add(++R);

        while (L < q.l) del(L++);
        while (R > q.r) del(R--);
    }
}

```

```

        res[q.pos] = calc(1, R-L+1);
    }
    return res;
}

```

2 DP Optimizations

2.1 convex hull trick

```

3.9 persistent seg tree

/* Problem: <https://cses.fi/problemset/task/1737/>
 * Your task is to maintain a list of arrays which initially has a single array. You have to process the following types of queries:
 * Query 1: Set the value a in array k to x.
 * Query 2: Calculate the sum of values in range [a,b] in array k.
 * Query 3: Create a copy of array k and add it to the end of the list.
 * Idea to create a persistent segment tree to save all version of array.
 */

4.4 triangles

Let a , b , c be length of the three sides of a triangle.

$$p = (a + b + c) * 0.5$$

The inradius is defined by:

$$iR = \sqrt{\frac{(p-a)(p-b)(p-c)}{p}}$$

The radius of its circumcircle is given by the formula:

$$cR = \frac{abc}{\sqrt{(a+b+c)(a+b-c)(a+c-b)(b+c-a)}}$$

```

5.8 konig's theorem

In any bipartite graph, the number of edges in a maximum matching equals the number of vertices in a minimum vertex cover

5.9 minimum path cover in DAG

Given a directed acyclic graph $G = (V, E)$, we are to find the minimum number of vertex-disjoint paths to cover each vertex in V .

We can construct a bipartite graph $G' = (V_{out} \cup V_{in}, E')$ from G , where :

$$V_{out} = \{v \in V : v \text{ has positive out-degree}\}$$

$$V_{in} = \{v \in V : v \text{ has positive in-degree}\}$$

$$E' = \{(u, v) \in V_{out} \times V_{in} : (u, v) \in E\}$$

Then it can be shown, via König's theorem, that G' has a matching of size m if and only if there exists $n - m$ vertex-disjoint paths that cover each vertex in G , where n is the number of vertices in G and m is the maximum cardinality bipartite matching in G' .

Therefore, the problem can be solved by finding the maximum cardinality matching in G' instead.

NOTE: If the paths are not necessarily disjoint, find the transitive closure and solve the problem for disjoint paths.

5.10 planar graph (euler)

Euler's formula states that if a finite, connected, planar graph is drawn in the plane without any edge intersections, and v is the number of vertices, e is the number of edges and f is the number of faces (regions bounded by edges, including the outer, infinitely large region), then:

$$f + v = e + 2$$

It can be extended to non connected planar graphs with c connected components:

$$f + v = e + c + 1$$

6 Math

6.1 Lucas theorem

For non-negative integers m and n and a prime p , the following congruence relation holds :

$$\binom{m}{n} \equiv \prod_{i=0}^k \binom{m_i}{n_i} \pmod{p},$$

where :

$$m = m_k p^k + m_{k-1} p^{k-1} + \cdots + m_1 p + m_0,$$

and :

$$n = n_k p^k + n_{k-1} p^{k-1} + \cdots + n_1 p + n_0$$

are the base p expansions of m and n respectively. This uses the convention that $\binom{m}{n} = 0$ if $m < n$.

6.2 counting

```
const int MN = 1e5 + 100;
long long fact[MN];

void fill_fact() {
    fact[0] = 1;
    for (int i = 1; i < MN; i++) {
        fact[i] = mult(fact[i - 1], i);
    }
}

long long perm_rep(vector<int> &frec) {
    int total = 0;
    long long den = 1;
    for (int i = 0; i < (int)frec.size(); i++) {
        den = mult(den, mod_inv(fact[frec[i]]));
        total += frec[i];
    }
    return mult(fact[total], den);
}
```

6.3 cumulative sum of divisors

```
/**
The function SOD(n) (sum of divisors) is defined
as the summation of all the actual divisors of
an integer number n. For example,

    SOD(24) = 2+3+4+6+8+12 = 35.

The function CSOD(n) (cumulative SOD) of an integer n, is defined as
below:

    csod(n) = \sum_{i=1}^n sod(i)

It can be computed in O(sqrt(n)):
*/
```

```
long long csod(long long n) {
    long long ans = 0;
    for (long long i = 2; i * i <= n; ++i) {
        long long j = n / i;
```

```
        ans += (i + j) * (j - i + 1) / 2;
        ans += i * (j - i);
    }
    return ans;
}
```

6.4 fft

```
/**
 * Fast Fourier Transform.
 * Useful to compute convolutions.
 * computes:
 *     C(f star g)[n] = sum_m(f[m] * g[n - m])
 * for all n.
 * test: icpc live archive, 6886 - Golf Bot
 * */
```

6.5 fibonacci properties

Let A, B and n be integer numbers.

$$k = A - B \quad (1)$$

$$F_A F_B = F_{k+1} F_A^2 + F_k F_A F_{A-1} \quad (2)$$

$$\sum_{i=0}^n F_i^2 = F_{n+1} F_n \quad (3)$$

$ev(n)$ = returns 1 if n is even.

$$\sum_{i=0}^n F_i F_{i+1} = F_{n+1}^2 - ev(n) \quad (4)$$

$$\sum_{i=0}^n F_i F_{i-1} = \sum_{i=0}^{n-1} F_i F_{i+1} \quad (5)$$

6.6 polynomials

```
const double pi = acos(-1);
struct poly {
    deque<double> coef;
    double x_lo, x_hi;

    double evaluate(double x) {
        double ans = 0;
        for (auto it : coef)
            ans = (ans * x + it);
        return ans;
    }

    double volume(double x, double dx=1e-6) {
        dx = (x_hi - x_lo) / 1000000.0;
        double ans = 0;
        for (double ix = x_lo; ix <= x; ix += dx) {
            double rad = evaluate(ix);
            ans += pi * rad * rad * dx;
        }
        return ans;
    }
}
```

```
};
```

6.7 sigma function

the sigma function is defined as:

$$\sigma_x(n) = \sum_{d|n} d^x$$

when $x = 0$ is called the divisor function, that counts the number of positive divisors of n .

Now, we are interested in find

$$\sum_{d|n} \sigma_0(d)$$

if n is written as prime factorization:

$$n = \prod_{i=1}^k P_i^{e_k}$$

we can demonstrate that:

$$\sum_{d|n} \sigma_0(d) = \prod_{i=1}^k g(e_k + 1)$$

where $g(x)$ is the sum of the first x positive numbers:

$$g(x) = (x * (x + 1)) / 2$$

7 Matrix

7.1 matrix

```
const int MN = 111;
const int mod = 10000;

struct matrix {
    int r, c;
    int m[MN][MN];

    matrix (int _r, int _c) : r (_r), c (_c) {
```

```

    memset(m, 0, sizeof m);
}

void print() {
    for (int i = 0; i < r; ++i) {
        for (int j = 0; j < c; ++j)
            cout << m[i][j] << " ";
        cout << endl;
    }
